

Examples from our trading

Here is an example of our precision moulded castings from our subcontractors. All products are custom made to highest possible quality, but with a low price.

Maritime applications

Polished stainless steel products for yachts and other maritime vessels. They do not only look good, they also have excellent resistance to corrosion making them well suited for use in any nautical environment.

Chemical industry applications

Precision moulded products, manufactured by Laholm Stål AB will survive even the harshest, most aggressive environments in any chemical plant. Each material is chosen according to application environment, making them a safe and cost-effective choice.

Food Processing applications

Within food processing the demands are high. Precision moulded and finished products have a high resistance against strong cleaning liquids during e.g. disinfection. This is an advantage in environments where cleanliness requirements are higher than usual.

Pulp and paper applications

Wherever strong chemical liquids are used, the corrosion resistance demands are higher than usual. Precision moulded stainless steel products from Laholm Stål AB meet and exceed these demands making them very well suited for the harsh environments in the paper and pulp industry.
